SPECIFICATION:

GENERAL
Frequency Range
24.265 – 29.655 MHz
Modes
CW/AM/FM/SSB
Frequency Control
Phase-Locked-Loop Synthesizer
Frequency Stability
0.001%
Temperature Range
-30°C to +50°C
Input Voltage
DC 13.8 V
Antenna Impedance
50 Ohms
Size
7 7/8"(W) x 9 1/4"(D) x 2 3/8"(H)
Weight
5 lbs

TRANSMITTER
RF Power Output (High)
AM/FM : 25W
RF Power Output (Low)
AM/FM : 4W
Spurious Emission
-50dB
Audio Distortion
10%
Frequency Response
300 to 2500Hz
Microphone
Dynamic

RECEIVER
Sensitivity
CW/AM 1.0uV for 10dB S+N/N
FM 1.0uV for 20dB S+N/N
SSB 0.5uV for 10dB S+N/N
Squelch Sensitivity
0.5uV
Selectivity
-55dB
Image Rejection
-50dB
Hum & Noise
40dB
Audio Output Power
2.5W at 10% THD

SPECIFICATIONS SUBJECT TO CHANGE WITHOUT NOTICE

INSTALLATION
LOCATION
Plan the location of the transceiver and microphone bracket before starting the installation. Select a location that is convenient for operation and does not interfere with the driver or passengers in the boat. The transceiver is usually mounted below the dash panel with the microphone bracket beside it.

MOUNTING THE CONNECTION
The transceiver is supplied with a universal mounting bracket. When mounting the bracket and radio to your car, make sure it is mechanically strong. Also provide a good electrical connection to the chassis of the boat. Proceed as follows to mount the transceiver:
1. After you have determined the most convenient location in your boat, hold the transceiver with mounting bracket in the exact location desired. If nothing will interfere with mounting it in the desired position, remove the mounting bolts. Before drilling the holes, make sure nothing will interfere with the installation of the mounting bolts.
2. Connect the antenna cable plug to the standard receptacle on the rear panel. Most transceiver antennas are terminated with a type PL-259 plug and mate with the receptacle.
3. Connect the red DC power input wire (with the fuse) to +13.8V DC. This wire extends from the rear panel. In boat installation, +13.8V DC is usually obtained from the accessory contact on the ignition switch. This prevents the set being left on accidentally when the driver leaves the boat and also permits operating the unit without the engine running. Locate the accessory contact on most ignition switches by tracing the power wire from the AM broadcast receiver in the boat.
4. Connect the black lead to -13.8V DC. This is usually the chassis of the boat. Any convenient location with good electrical contact (remove paint) may be used.
5. Mount the microphone bracket on the right side of the transceiver or near the transceiver, using two screws supplied. When mounting in a boat, place the bracket under the dash so the microphone is readily accessible.
IGNITION NOISE INTERFERENCE

Use of a boat receiver at low signal levels is normally limited by the presence of electrical noise. The primary source of noise in boat installations is from the generator and ignition system in the boat. Under most operating conditions, when signal level is adequate, the background noise does not present a serious problem. Also, when extremely low level signals are being received, the transceiver may be operated with boat engine turned off. The unit requires very little current and therefore will not significantly discharge the boat battery.

Even though the transceiver has ANL and NB controls, in some installation ignition interference may high enough to make good communications impossible. The electrical noise may come from several sources. Many possibilities exist variations between boat require different solutions to reduce the noise.

ANTENNA

A vertically polarized, quarter-wavelength whip antenna provides the most reliable operation and greatest ranger. Shorter, loaded-type whip antennas are more attractive, compact and adequate for applications where the maximum possible distance is not required. Also, the loaded whips do not present the problems of high imposed by a full quarter-wavelength whip.

Mobile whip antennas utilize the metal body of the boat as a ground plane. When mounted at a corner of the vehicle they are slightly directional, in the direction of the body of the vehicle. For all practical purpose, however, the radiation pattern is nondirectional. The slight directional characteristic will be observed only at extreme distances. A standard antenna connector (type SO-239) is provided on the transceiver for easy connection to a standard PL-259 cable termination.

If the transceiver is not mounted on a metal surface, it is necessary to run a separate ground wire from the unit to a good metal electrical ground in the boat. When installed in a boat, the transceiver will not operate at maximum efficiency without a ground plate, unless the vessel has steel hull.

Before installing the transceiver in a boat, consult your dealer for information regarding an adequate grounding system and prevention of electrolysis between fittings in the hull and water.

TUNING THE ANTENNA FOR OPTIMUM S.W.R.

Since there is such a wide variety of base and marine antennas, this section will strictly concern itself to the various types of mobile adjustable antennas.

Because the antenna lengths directly related to the channel frequency, it must be tuned to resonate optimally all channels of the transceiver. Low channel requires a longer antenna than high channel because it is lower in operate frequency.

Due to the various methods of adjusting antennas for proper S.W.R. we have chosen what we think is the optimum method:

A. Antenna with adjustment screws (set screws).
1. Start with the antenna extended and tighten the set screw lightly enough so that the antenna can be lightly tapped with your finger for easy adjustment.
2. Set your transceiver to middle channel. Press the PTT (push-to-talk) switch, and tap the antenna (making it shorter). The S.W.R. meter will show a lower reading each time the antenna is tapped. By continuing to shorten the antenna you will notice the S.W.R. reading will reach a low point and then start rising again. This means that you have passed the optimum point for middle channel. Extend the antenna a short distance and again follow the procedure above.

When the lowest point has been reached, switch to Low channel or high channel and compare S.W.R. readings. They should be almost equal.

B. Antennas which must be cut to proper length
1. Follow the same procedure as above, but adjust the length by cutting in 1/8" increments until a good match is obtained.
2. Be very careful not to cut too much at one time, as one it is cut, it can no longer be lengthened.
3. The whip is easily cut by filing a notch all the way around and breaking the piece off with pliers.

NOTE

THE PROPER SETTING IS ACHIEVED WHEN THE SWR IS 1.5 OR BELOW, AND WHEN IT HAS THE SAME READING FOR LOW OR HIGH CHANNELS.
If you are having difficulties in adjusting your antenna, check the following:
a. All doors must be closed when adjusting the antenna.
b. Make sure the antenna base grounded.
c. Check your coaxial cable routing (it may pinched when routed into the car.)
d. Try a different location on your car (keeping in mind the radiation pattern you wish.)
e. Is the antenna perfectly vertical?
f. Try a different location in your neighborhood. Stay away from large metal objects when adjusting (metal telephone or light post, fences, etc.)

**NOTE**
The transceiver will operate into an SWR of 2 to 1 indefinitely and sustain an SWR of 20:1 for a maximum of 5 minutes at rated operating conditions.

**External Speaker**
The external speaker jack (EXT.SPK) on the rear panel is used for remote receiver monitoring. The external speaker should have 8 ohms impedance and be able to handle at least 4 watts. When the external speaker is plugged in, the internal speaker is disconnected.

**OPERATION CONTROLS AND CONNECTIONS**

1. **SQUELCH CONTROL**: This control is used to control or eliminate receiver background noise in the absence of incoming signal. For maximum receiver sensitivity, it is desired that the control be adjusted only to the point where the receiver background noise is eliminated. Turn fully counterclockwise, then slowly clockwise until the receiver noise disappears. Any signal to be received must now be slightly stronger than the average received noise. Further clockwise rotation will increase the threshold level which a signal must overcome in order to be heard. Only strong signal will be heard at a maximum clockwise setting.

2. **ON/OFF VOLUME CONTROL**: Turn clockwise to apply power to the radio and to set the desired listening level.

3. **RF GAIN CONTROL**: This control is used to reduce the gain of the RF amplifier under strong signal conditions.

4. **MIC GAIN**: Adjusts the microphone gain in the transmit mode. This controls the gain to the extent that full talk power is available several inches away from the microphone.
5. **SWR CAL CONTROL**: This SWR CAL control allows the user to calibrate the SWR Meter.

6. **BAND SELECTOR**: This band selector allows the user to select the desired band.

7. **MODE CONTROL**: This control allows you to select one of three following operating modes: PA/FM/AM.

8. **COARSE/FINE CONTROL**: Allows variation of the receiver operating frequency above and below the assigned frequency. It may be used to optimize AM/FM signals as described in the operating procedure paragraphs.

9. **CHANNEL SELECTOR**: This control is used to select a desired transmit and receive channel.

10. **CHANNEL DISPLAY**: The channel display indicates the current selected channel.

11. **FRONT PANEL METER**: The front panel meter allows the user to monitor signal strength, RF output power and SWR level.

12. **S-RF/CAL/SWR SWITCH**: In the S-RF position, the meter will indicate the strength of the signal being received, as well as the relative RF output of transmission. When calibrating the SWR meter, you need to put this switch in the CAL position. To use the meter to measure the standing wave ratio, turn the switch to the SWR position.

13. **NB/ANL SWITCH**: When the switch is placed in the ANL/NB position, the RF noise blanker is activated. The noise blanker is very effective in eliminating repetitive impulse noise as ignition interference.

14. **BAND SWITCH**: The band switch allows the user to select the HI or LO band.

15. **ROGER BEEP SWITCH**: When this switch is placed in the ROGER BEEP position, the radio automatically transmits an audio tone at the end of your transmission. This indicates the end of your transmission so the people who are having trouble hearing you will know that you are done speaking. As a courtesy to others, use the Roger Beep only when necessary.

16. **TX/RX LED**: The red LED indicates the radio is in the transmit mode. The green indicated the radio is in the receive mode.

---

**REAR PANEL CONNECTOR**

1. **ANTENNA**: This jack accepts 50 ohm coaxial cable with a PL-259 type plug.

2. **POWER**: This accepts 13.8VDC power cable with built-in fuse. The power cord provided with the radio has a black and red wire. The black goes to negative and the red goes to positive.

3. **CW KEY**: This is used for Morse Code operation. To operate this mode, connect a CW key to this jack and place the mode switch in the CW position.

4. **EXTERNAL SPEAKER**: This jack accepts 4 to 8 ohm, 5 watt external speaker. When the external speaker is connect to this jack, the built-in speaker will be disable.

5. **FREQUENCY COUNTER CONNECTOR**: This connector is used to connect RANGER frequency counter FC-390, that you can watch channel frequency digitally.
OPERATION

A. MICROPHONE
The receiver and transmitter are controlled by the push-to-talk switch on the microphone. Press the switch and the transmitter is activated, release switch to receive. When transmitting hold the microphone two inch from the mouth and speak clearly in a normal "voice". The transceiver come complete with low-impedance dynamic microphone.

B. PROCEDURE TO RECEIVE
1. Be sure that power source, microphone and antenna are connected to the proper connectors before going to the next step.
2. Turn unit on by turning VOL knob clockwise on transceiver.
3. Set the VOL for a comfortable listening level.
4. Set the MODE switch to the desire mode.
5. Listen to the background noise from the speaker. Turn the SQ knob slowly clockwise until the noise just disappear. Leave the control at this setting. This SQ is now properly adjusted. The receiver will remain quiet until a signal is actually received. Do not advance the control too far, or some of weaker signals will not be heard.
6. Set the CHANNEL select or switch to the desired channel.
7. Set the RF gain control fully clockwise for maximum RF gain.
8. Adjust the COARSE/FINE control to clarify the SSB/CW Signals or to optimize AM/FM signals.

C. PROCEDURE TO TRANSMIT
1. Select the desired channel of transmission
2. Set the MIC GAIN control fully clockwise.
3. If the channel is clear, depress the push-to-talk switch on the microphone and speak in a normal voice.
